

## Cisco Aironet 1250 Series Access Point

The Cisco® Aironet® 1250 Series is a rugged indoor access point designed for challenging RF environments that require the antenna versatility associated with connectorized antennas, a rugged metal enclosure, and a broad operating temperature range. The first enterprise-class access point to support the IEEE 802.11n draft 2.0 standard, it offers combined data rates of up to 600 Mbps to provide users with mobile access to high-bandwidth data, voice, and video applications. 802.11n provides reliable and predictable WLAN coverage to improve the end-user experience for both existing 802.11a/b/g clients and new 802.11n clients.

As part of the Cisco Unified Wireless Network, the 1250 Series provides the industry's lowest total cost of ownership and investment protection by integrating seamlessly with the existing network. With a Gigabit Ethernet (10/100/1000) interface, the Cisco Aironet 1250 Series offers the flexibility of inline as well as local power options.

### RF Excellence

The Cisco Unified Wireless Network with M-Drive technology removes the mystery associated with design, implementation, and ongoing optimization of enterprise wireless networks. With Cisco M-Drive technology, IT has the tools needed to build and operate a high-performance wireless network without the need for extensive RF engineering skills. Cisco M-Drive technology is a systemwide approach that manages the corporate RF spectrum, improves wireless coverage, and increases system capacity and performance. Features include:

- Radio resource management (RRM): Automated self-healing optimizes RF to reduce unpredictability and dead spots and to help ensure high-availability client connections. RRM optimizes network capacity and mitigates interference by continuously monitoring and adjusting access point power and channel settings and then load balancing clients to enhance wireless coverage.

#### Performance with Investment Protection

- Up to nine times faster than 802.11a/g networks
- Backward-compatible with 802.11a/b/g clients
- M-Drive technology optimizes RF

#### Flexible Platform

- Versatile RF coverage with external antennas
- Supports both 2.4-GHz and 5-GHz modules

#### Rugged Metal Housing and Extended Operating Temperature

- Ideal for factories, warehouses, and other industrial environments
- UL 2043 plenum rated for above ceiling installation options or suspended from drop ceilings

#### Secure Interoperability

- 802.11n draft 2.0 compliant
- Intel Connect with Centrino Certified

#### Simplified Network Management

- Controller-based or standalone deployment options
- CleanAir® technology reduces troubleshooting and performance impacts

#### Secure Connections

- Supports rogue access point detection and denial of service attacks
- Management frame protection detects malicious users and alerts network administrators

#### Greater Network Capacity

- Dynamic frequency selection 2 (DFS-2) compliant

- CleanAir technology: Only Cisco offers a comprehensive solution to detect, classify, locate, and mitigate sources of interference, including non-Wi-Fi sources such as Bluetooth, microwave ovens, cordless phones, and more. With the ability to visualize performance-impacting interference directly from the Cisco Wireless Control System (WCS), you can proactively manage the challenges of a shared wireless spectrum and optimize network performance.

### Power Options

The Cisco Aironet 1250 Series Access Point can be powered by a Cisco Ethernet switch, a power injector, or a local power supply. The number of radio modules determines which Cisco Ethernet switch can power the Aironet 1250 Series Access Point.

#### Powering the Aironet 1250 Series Access Point with 802.3af Power over Ethernet

The Aironet 1250 Series Access Point with one RM1252 radio module installed requires 12.95W, which is within the 802.3af Power over Ethernet (PoE) standard. Any Cisco switch supporting 802.3af may be used to power the Aironet 1250 Series Access Point with one RM1252 radio module installed. This is ideal for businesses that chose to only deploy on a single frequency (2.4 GHz or 5 GHz). A single radio provides optimum performance with approximately 300 Mbps maximum PHY data rate. Customers who deploy dual-band, 802.11n radios and power the 1250 Series using standard 802.3af will have more reliable and predictable coverage than that provided by traditional 802.11a/g networks; however, operation will be limited to a single transmitter per radio with maximum PHY data rates of 150 Mbps instead of 300 Mbps per radio. Customers with a significant investment in 802.11 a/b/g client devices that have low-to-medium bandwidth needs but high-reliability requirements will benefit the most from this type of deployment scenario.

#### Powering the Aironet 1250 Series Access Point with Cisco Enhanced PoE

Cisco Enhanced PoE was designed for customers who want to install new PoE-enabled technologies that require greater than 15.4W per port to function at full capability, such as wireless technology based on the IEEE 802.11n standard. Cisco Enhanced PoE provides the full power requirements for dual-radio modules and eliminates the need to run an additional cabling drop or insert a separate power injector. Support for Enhanced PoE is currently available on a variety of Cisco Catalyst® switching platforms. For more information on Enhanced PoE, visit <http://www.cisco.com/en/US/prod/switches/epoe.html>.

### Product Specifications

Table 1 lists the product specifications for Cisco Aironet 1250 Series Access Points.

**Table 1.** Product Specifications for Cisco Aironet 1250 Series Access Points

<b>Input Power Requirements</b>	<ul style="list-style-type: none"> <li>AP1250: 36 to 57 VDC</li> <li>Power Supply and Power Injector: 100 to 240 VAC; 50 to 60 Hz</li> </ul>		
<b>Powering Options</b>	<ul style="list-style-type: none"> <li>Cisco Catalyst switch port capable of sourcing 20W or greater</li> <li>Cisco AP1250 Power Injector (AIR-PWRINJ4)</li> <li>Cisco AP1250 Local Power Supply (AIR-PWR-SPLY1)</li> <li>802.3af switch (AP1250 with single radio only)</li> </ul>		
<b>Power Draw</b>	<ul style="list-style-type: none"> <li>AP1250 with two RM1252 radio modules installed: 18.5W</li> <li>AP1250 with one RM1252 radio module installed: 12.95W</li> </ul> <p><b>Note:</b> For a 1250 Series Access Point with two radios, 18.5W is the maximum power required at the access point (powered device). When deployed using PoE, the power drawn from the power sourcing equipment will be higher by some amount dependent on the length of the interconnecting cable. This additional power may be as high as 1.5W, bringing the total system power draw (access point + cabling) to 20W. A similar consideration applies for a 1250 Series Access Point with one radio.</p>		
<b>Warranty</b>	90 days
